# **pulse\_train Documentation**

*Release 2012-06*

**Kurt Goetze, BCDA**

June 05, 2012

# CONTENTS

<b>1</b>	<b>Coaching on the use of reStructuredText</b>	<b>3</b>
1.1	SVN export this example documentation . . . . .	3
1.2	Example 1 . . . . .	3
1.3	Example 2 . . . . .	4
<b>2</b>	<b>Indices and tables</b>	<b>9</b>
	<b>Index</b>	<b>11</b>

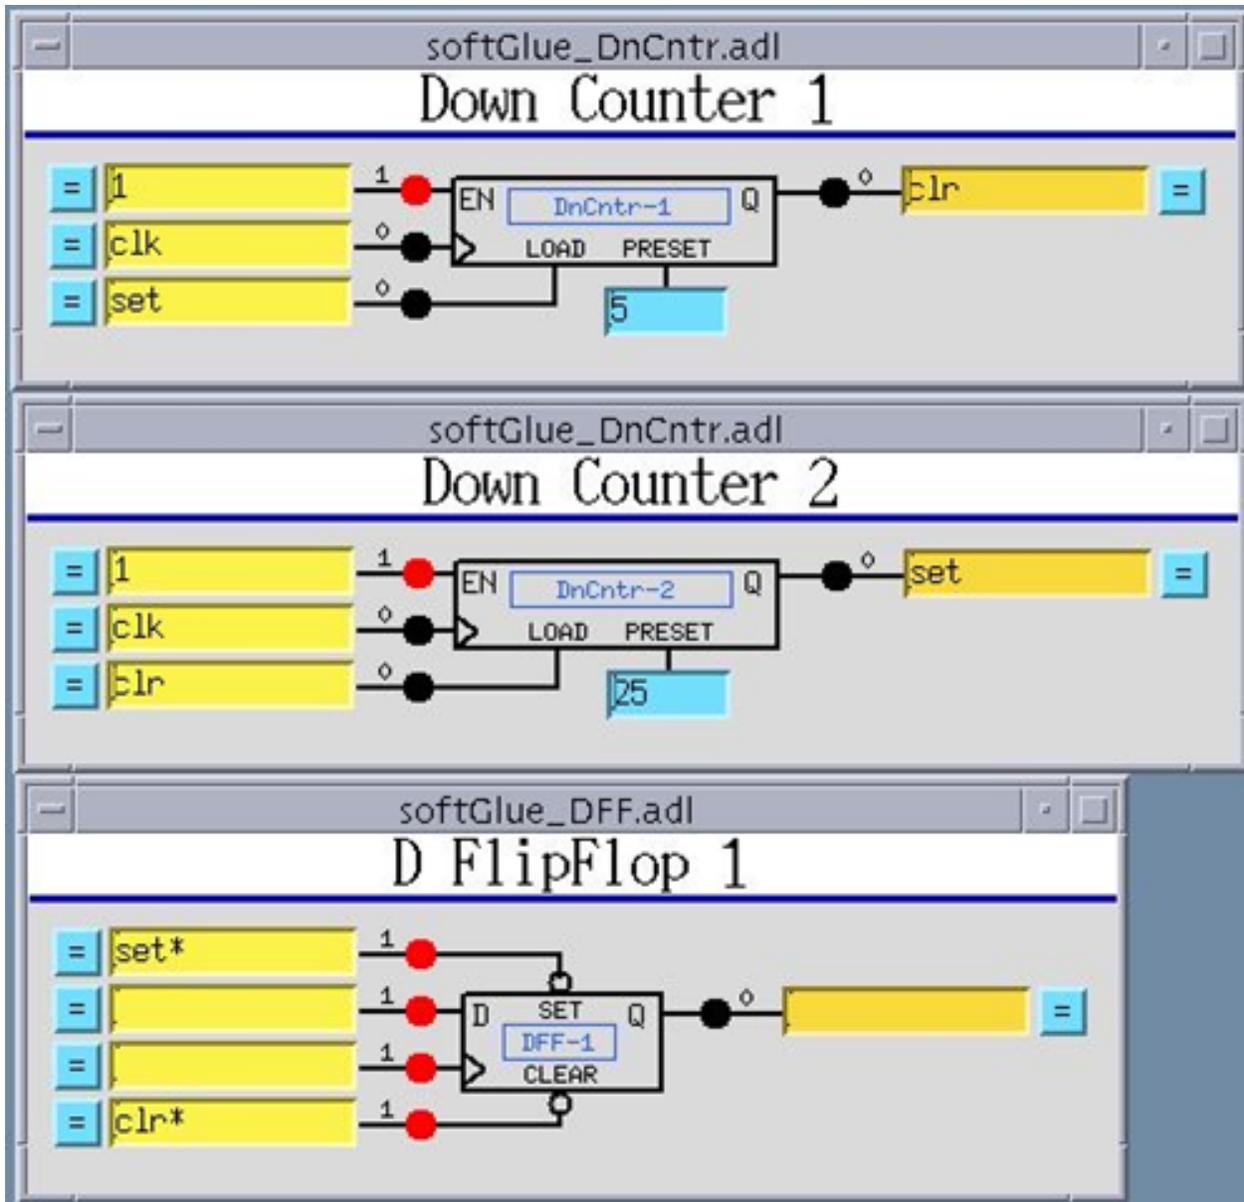

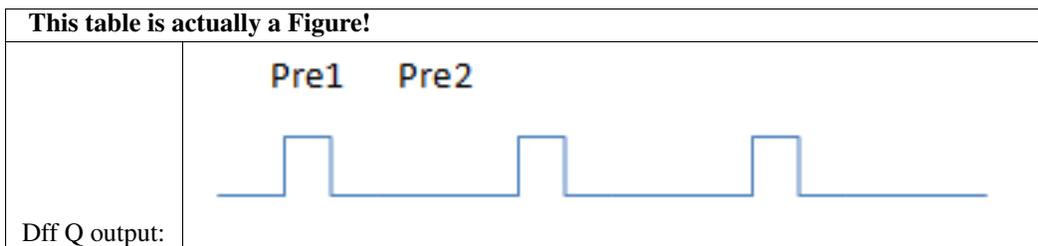

Figure 1: the figure caption says “Three MEDM screens”

- Time resolution set by clock frequency (clk).
- Down Counter 1 PRESET programs On Time.
- Down Counter 2 PRESET programs Off Time.

Contents:

# COACHING ON THE USE OF RESTRUCTUREDTEXT

---

**Note:** Web documentation available at: [https://subversion.xor.aps.anl.gov/bcdaext/pulse\\_train\\_doc/build/html/index.html](https://subversion.xor.aps.anl.gov/bcdaext/pulse_train_doc/build/html/index.html)

---

This is a just an example of writing the documentation using sphinx.<sup>1</sup> It is easy to edit the documentation since it is text. You can find the built html documentation in `build/html/index.html`. To build the documentation, you need to be in the `sphinxdoc` (or whatever you name it) directory, then type:

```
make html
```

It may be useful, sometimes, to completely rebuild the documentation. To do that, type:

```
make clean  
make html
```

You can get PDF documentation, as well. To do that, type:

```
make latexpdf
```

and then pick that up in `build/latex/pulse_train.pdf`.<sup>2</sup>

## 1.1 SVN export this example documentation

You can pull this example from its subversion repo and add it to your project by going to the desired directory (perhaps the TOP directory for your support) and exporting from this subversion repository:

```
svn export https://subversion.xor.aps.anl.gov/bcdaext/pulse_train_doc sphinxdoc
```

## 1.2 Example 1

Here is some more text.

This text is an inset.

---

<sup>1</sup> Sphinx uses Python. You may want to build this on an APS SunOS or linux computer. If so, you'll need to make sure that the `/APSShare/epd/{architecture_choice}/bin` directory is on your executable path.

<sup>2</sup> You can change a lot of options in the `source/conf.py` file.

## 1.3 Example 2

Tell about example 2.

### 1.3.1 inline code, external code, and other literal examples

Use a different underline symbol for each section level. To use `literal` text, surround text with double backticks or end a paragraph with a double colon:

place a blank line  
then indent the text to be made to look like a program

It is possible to include all or even part of code files in any accessible directory.

```
1 # this is some example C code
2 for (i=10; i; i--) i*i;

4 Documentation of Programmable pulse train
5 =====
6
7 .. figure:: adl_screens.png
8
9     the figure caption says "Three MEDM screens"
10
11 .. this is a bit fancier for a figure, using a table
12     to get a fancier title bar since the figure caption
13     above looks very plain.
14
15 +-----+-----+
16 | This table is actually a Figure! |
